Tomas Pajdla
(CIIRC CTU in Prague)

Goal:

Reconstruct 3D scenes and camera poses from 2D images

3D Reconstruction Pipeline

Input images

Image Matching

Camera Geometry

Cameras & points

Identify common points and lines on given images

Reconstruct 3D points and lines as well as camera poses

This is an **algebraic** problem!

Example: The 5-Point Problem

- Given: 2 images showing **5** points
- Goal: recover **5** points in 3D, and both (relative) camera poses

This problem has 20 solutions for generic input images (counted over the complex numbers).

An Underconstrained Problem

- Given: 2 images showing **4** points
- Goal: recover **4** points in 3D, and both (relative) camera poses

This problem has **infinitely many** solutions for generic input images.

An Overconstrained Problem

- Given: 2 images showing **6** points
- Goal: recover **6** points in 3D, and both (relative) camera poses

This problem has 0 solutions for generic input images.

Some input images have solutions, but they are **not stable under noise** in the input images!

Minimal Problems

Definition: A 3D reconstruction problem is **minimal** if

$$0 < \# \text{ solutions} < \infty$$

for **generic (random)** input images.

∞ solutions
not minimal

20 solutions
minimal

0 solutions
not minimal

Fundamental Research Questions

1. Can we list **all** minimal problems?
2. How many solutions do they have?

We do not only want to work with **points**,
but also with **lines** and their incidences!

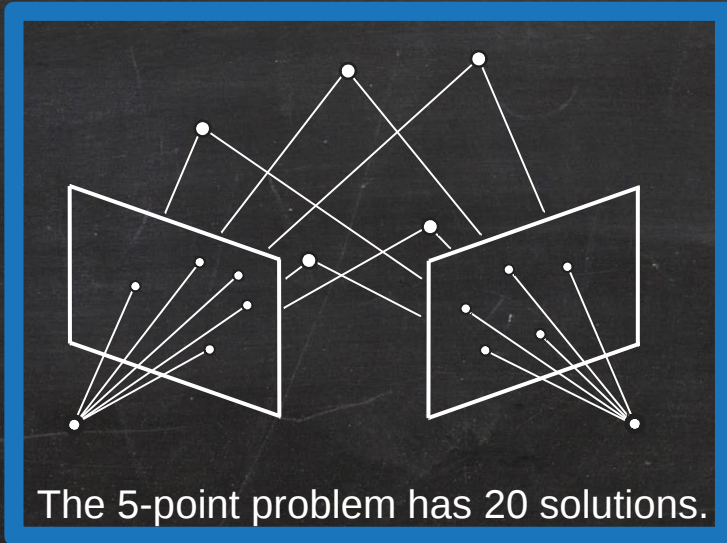

Our Result

We provide the **first complete classification of all minimal problems** when all points and lines are visible in each given image.

Our Result

We provide the **first complete classification of all minimal problems** when all points and lines are visible in each given image.

The 5-point problem has 20 solutions.

RESULT

There are **exactly 30 minimal problems** for *complete multi-view visibility* (modulo extra lines in 2 views).

# views	6	5	5	5	4
# sols	$\approx 10^6$	11296	26240	11008	3040
# views	4	4	4	4	4
# sols	4512	1728	32	544	544
# views	3	3	3	3	3
# sols	360	552	480	264	432
# views	3	3	3	3	3
# sols	328	480	240	64	216
# views	3	3	3	3	3
# sols	212	991	10	144	144
# views	3	3	2	2	2
# sols	144	64	20	16	12

Our Result

RESULT

We provide the **first complete classification of all minimal problems** when all points and lines are visible in each given image.

There are **exactly 30 minimal problems** for complete multi-view visibility (modulo extra lines in 2 views).

# views	6	5	5	5	4
# sols	$\approx 10^6$	11296	26240	11008	3040

# views	3	3	2	2	2
# sols	144	64	20	16	12

First solver for such a high-degree problem based on state-of-the-art algorithms from **numerical algebraic geometry**:

TRPLP – Trifocal Relative Pose from Lines at Points, Fabbri et. al., CVPR 2020

This problem has 312 solutions (counted over the complex numbers).

Our Result

We provide the **first complete classification of all minimal problems** when all points and lines are visible in each given image.

We measure the complexity of each **minimal problem** by computing its number of solutions (counted over the complex numbers).

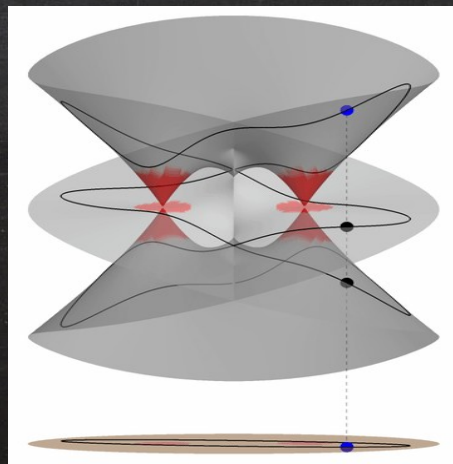

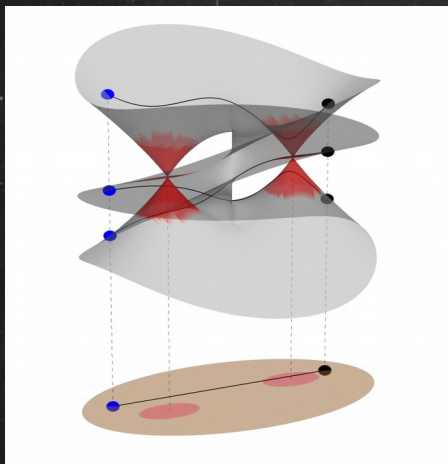

RESULT

There are **exactly 30 minimal problems** for complete multi-view visibility (modulo extra lines in 2 views).

# views	6	5	5	5	4
# sols	$\approx 10^6$	11296	26240	11008	3040
# views	4	4	4	4	4
# sols	4512	1728	32	544	544

# views	3	3	2	2	2
# sols	144	64	20	16	12

Our Tools: Nonlinear Algebra

- **Algebraic geometry**
for proof of classification
- **Gröbner bases**
symbolic computation of #sols
for 2 & 3 views
- **Homotopy continuation & monodromy**
numerical computation of #sols
for 4, 5 & 6 views

RESULT

There are **exactly 30 minimal problems** for *complete multi-view visibility* (modulo extra lines in 2 views).

# views	6	5	5	5	4
# sols	$\approx 10^6$	11296	26240	11008	3040
# views	4	4	4	4	4
# sols	4512	1728	32	544	544
# views	3	3	3	3	3
# sols	360	552	480	264	432
# views	3	3	3	3	3
# sols	328	480	240	64	216
# views	3	3	3	3	3
# sols	312	224	40	144	144
# views	3	3	2	2	2
# sols	144	64	20	16	12

What about partial visibility?

There can be missing data / occlusions in the given images.

Image 1

Image 2

Image 3

- Minimal problems with complete visibility have at most 6 views.
Minimal problems with partial visibility exists for arbitrarily many views!

⇒ Assume: **3 views**

- There are still ∞ minimal problems, and their classification is hard!

⇒ Assume: **each line is adjacent to at most 1 point**

There are still ∞ minimal problems!

Our Result

We **completely classify all minimal problems for 3 views** when each line is adjacent to at most 1 point:

There are **74575** equivalence classes of minimal problems.

Among them, **759** have **less than 300** solutions.

# solutions	64	80	144	160	216	224	240	256	264	272	288
# problems	13	9	3	547	7	2	159	2	2	11	4

There are **51** equivalence classes of minimal problems without incidences.

Final comment: Interaction between different sciences is key!

**Thanks for
your attention!**
