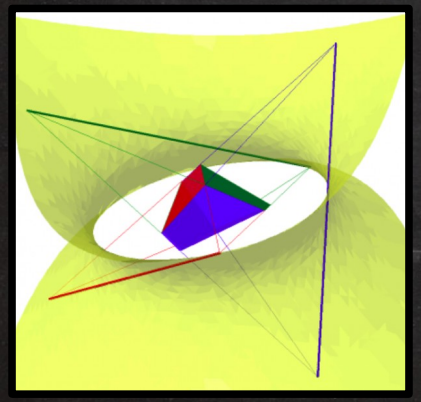
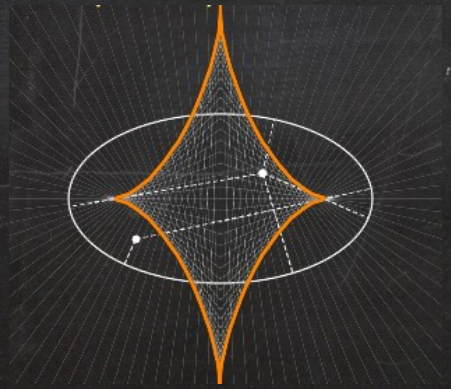
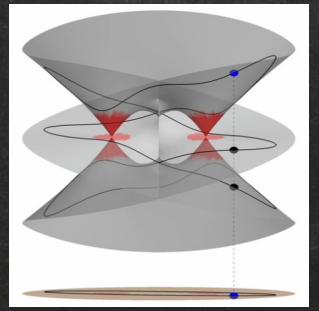
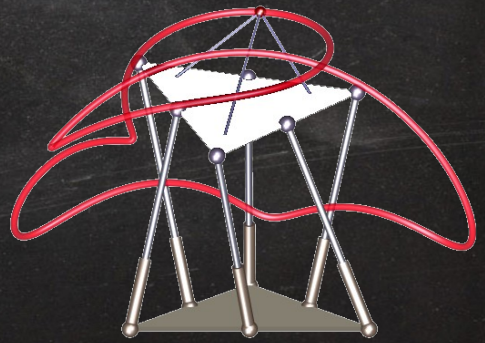
Nonlinear Algebra & Computer Vision

Kathlén Kohn









Linear algebra

All undergraduate students learn about Gaussian elimination, a general method for solving linear systems of algebraic equations:

Input:

$$x + 2y + 3z = 5$$
$$7x + 11y + 13z = 17$$
$$19x + 23y + 29z = 31$$

Output:

$$x = -35/18$$
$$y = 2/9$$
$$z = 13/6$$

Solving very large linear systems is central to applied mathematics.

Nonlinear algebra

Lucky students also learn about Gröbner bases, a general method for non-linear systems of algebraic equations:

Input:

$$x^2 + y^2 + z^2 = 2$$
$$x^3 + y^3 + z^3 = 3$$
$$x^4 + y^4 + z^4 = 4$$

Output:

$$3z^{12} - 12z^{10} - 12z^9 + 12z^8 + 72z^7 - 66z^6 - 12z^4 + 12z^3 - 1 = 0$$

$$4y^2 + (36z^{11} + 54z^{10} - 69z^9 - 252z^8 - 216z^7 + 573z^6 + 72z^5 - 12z^4 - 99z^3 + 10z + 3)\, y + 36z^{11} + 48z^{10} - 72z^9 - 234z^8 - 192z^7 + 564z^6 - 48z^5 + 96z^4 - 96z^3 + 10z^2 + 8 = 0$$

$$4x + 4y + 36z^{11} + 54z^{10} - 69z^9 - 252z^8 - 216z^7 + 573z^6 + 72z^5 - 12z^4 - 99z^3 + 10z + 3 = 0$$

This is very hard for large systems, but . . .

The world is non-linear!

Many models in the sciences and engineering are characterized by polynomial equations. Such a set is an algebraic variety.

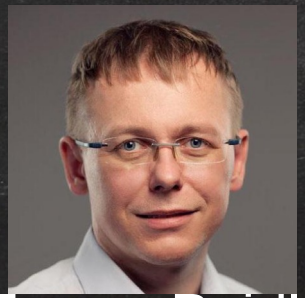
PLMP – Point-Line Minimal Problems in Complete Multi-View Visibility
best student paper award at ICCV 2019
arXiv: 1903.10008

joint works with

Timothy Duff
(Georgia Tech)

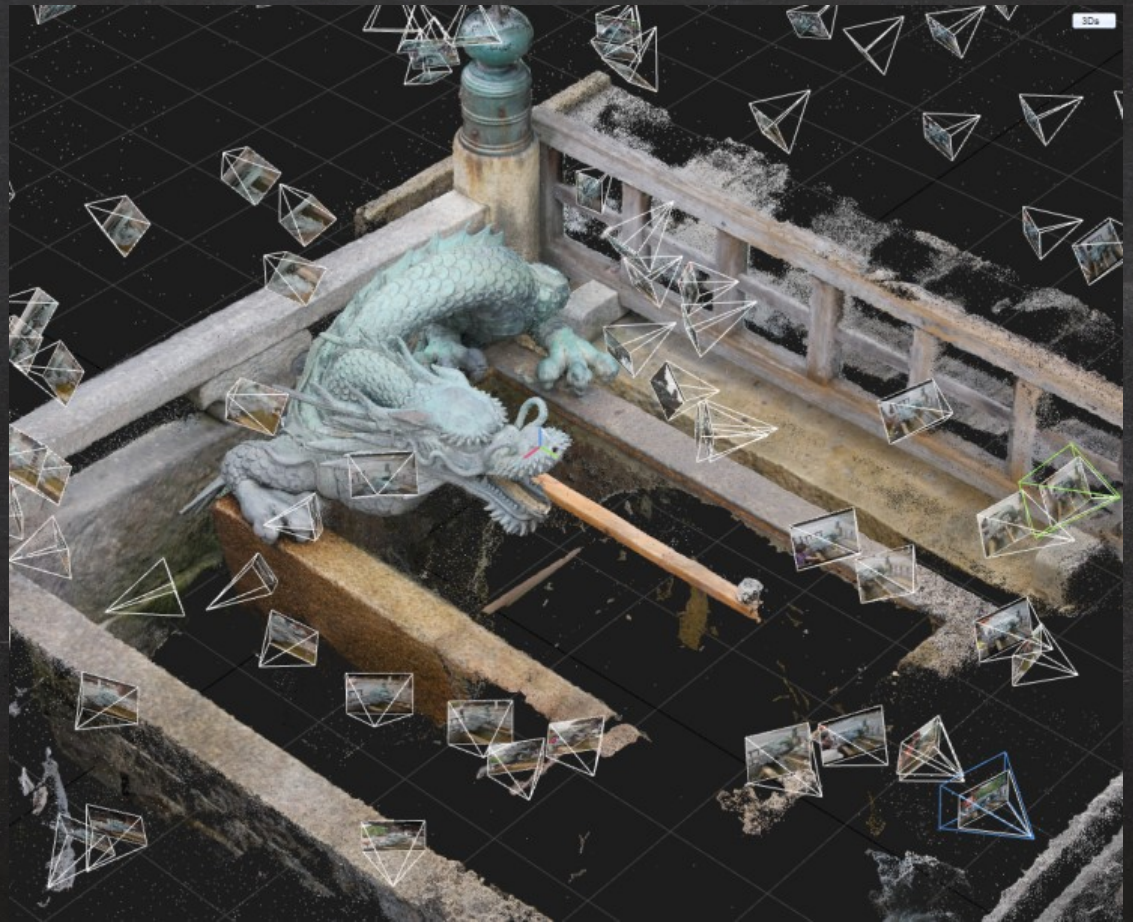
Anton Leykin
(Georgia Tech)



Tomas Pajdla
(CIIRC CTU in Prague)

Goal:

Reconstruct 3D scenes and camera poses from 2D images



3D Reconstruction Pipeline

Input images

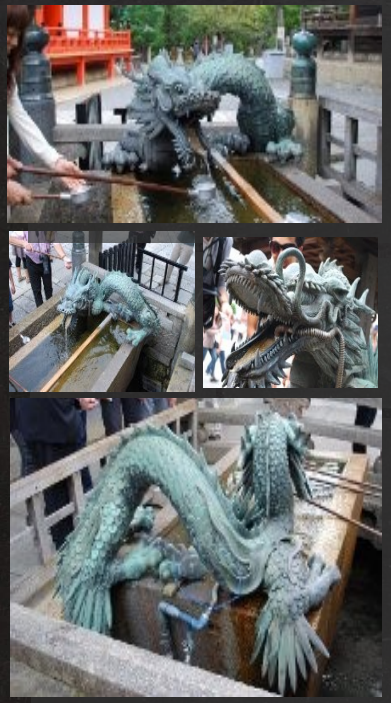


Image Matching

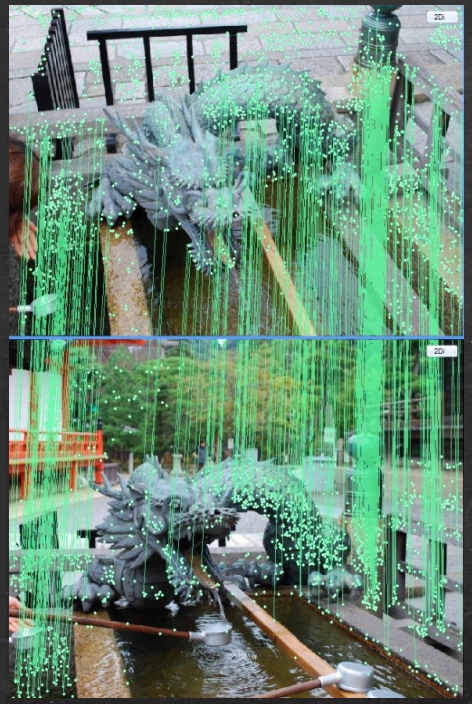
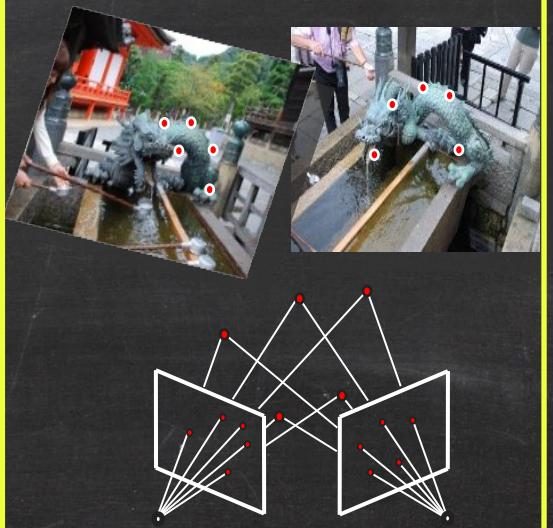


Identify common points and lines on given images

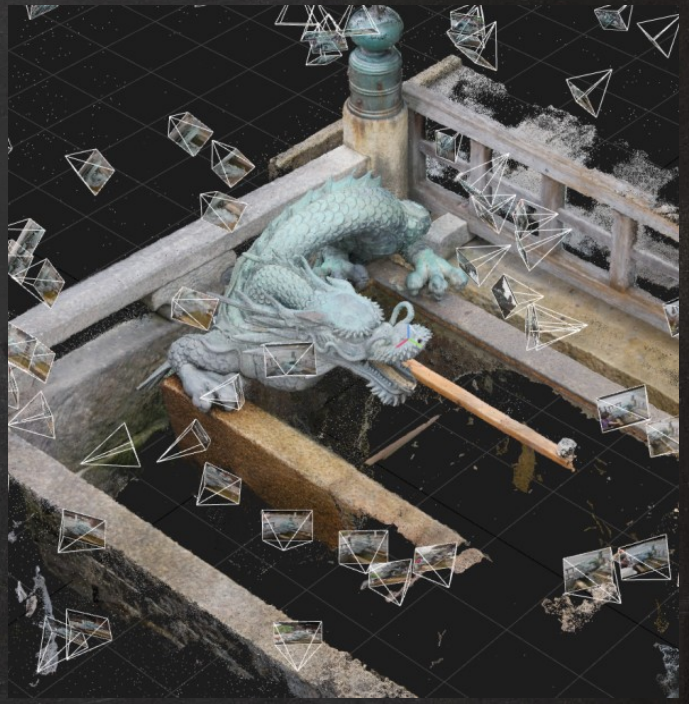
Camera Geometry



Reconstruct 3D points and lines as well as camera poses

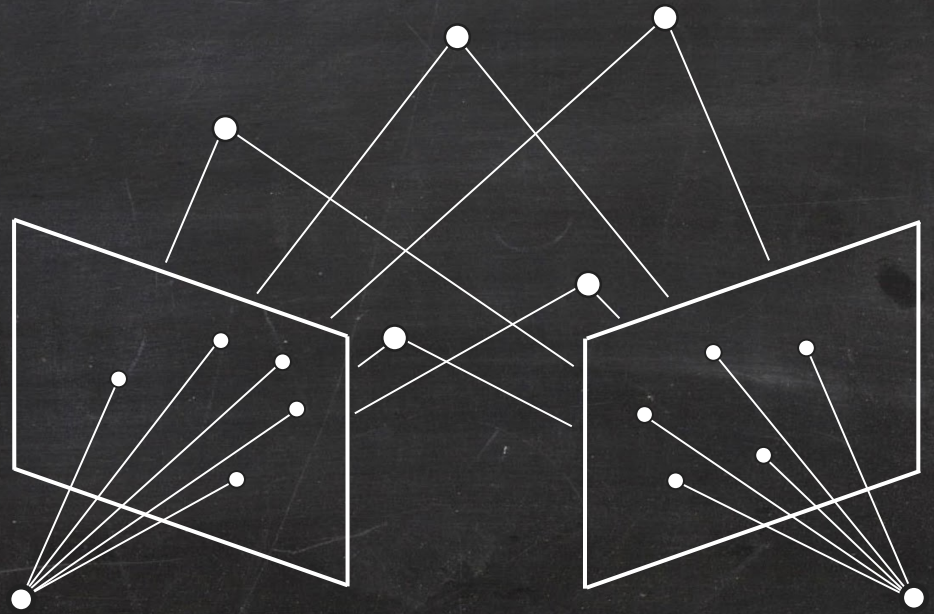
This is an **algebraic** problem!

Cameras & points



Example: The 5-Point Problem

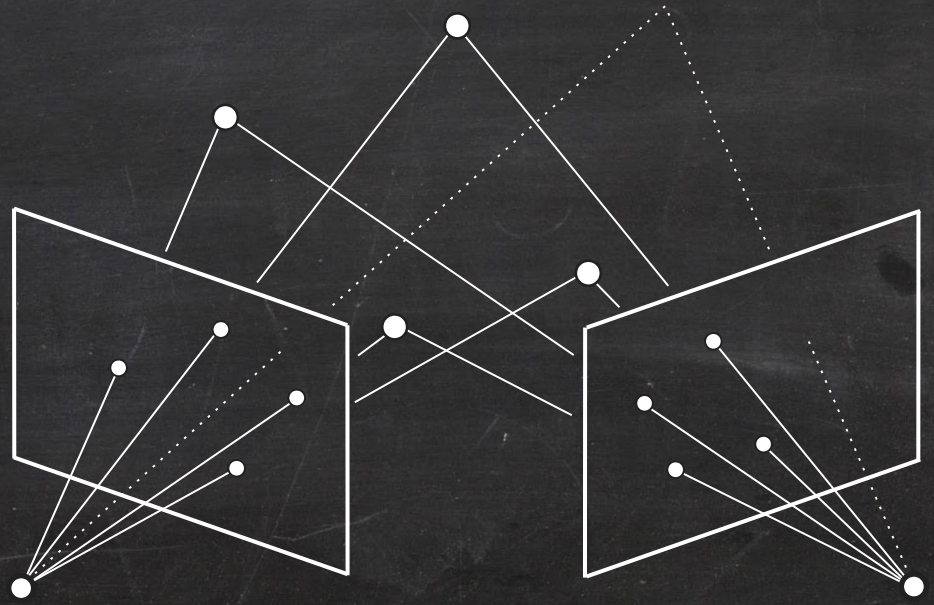
- Given: 2 images showing **5** points
- Goal: recover **5** points in 3D, and both (relative) camera poses



This problem has 20 solutions for generic input images
(counted over the complex numbers).

An Underconstrained Problem

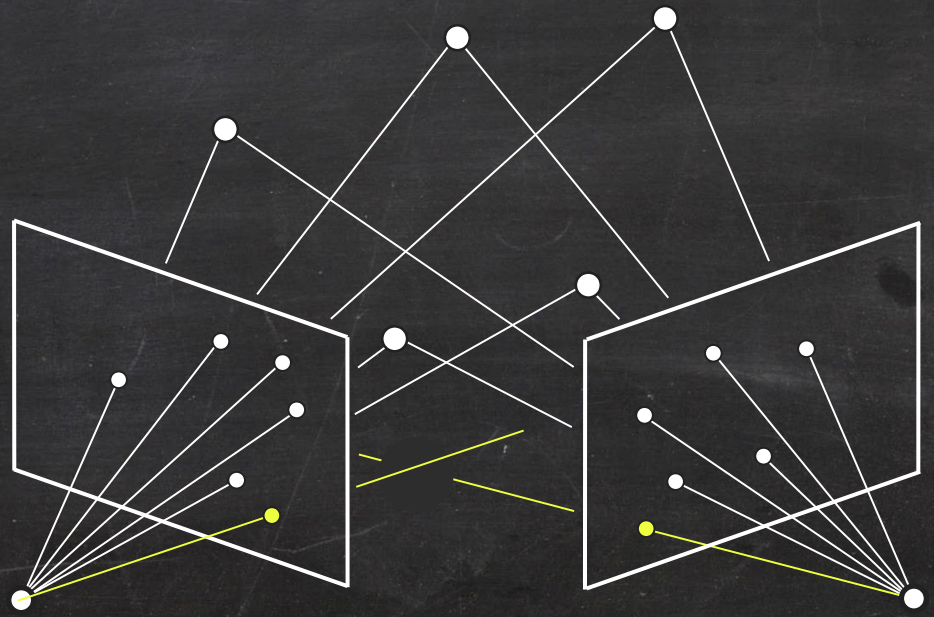
- Given: 2 images showing **4** points
- Goal: recover **4** points in 3D, and both (relative) camera poses



This problem has infinitely many solutions for generic input images.

An Overconstrained Problem

- Given: 2 images showing **6** points
- Goal: recover **6** points in 3D, and both (relative) camera poses



This problem has 0 solutions for generic input images.

(Some input images have solutions, but they are **not stable under noise** in the input images!)

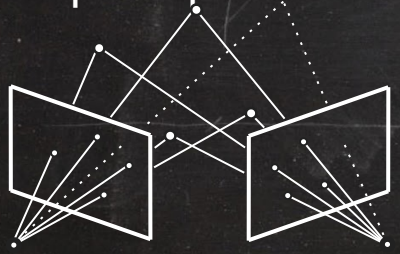
Minimal Problems

Definition: A 3D reconstruction problem is **minimal** if

$$0 < \#\ \text{solutions} < \infty$$

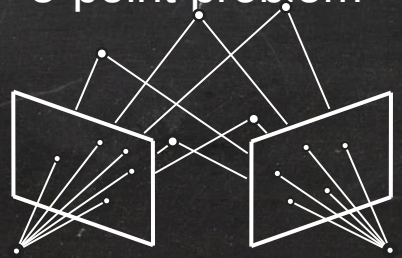
for generic (random) input images.

4-point problem



∞ solutions
not minimal

5-point problem



20 solutions
minimal

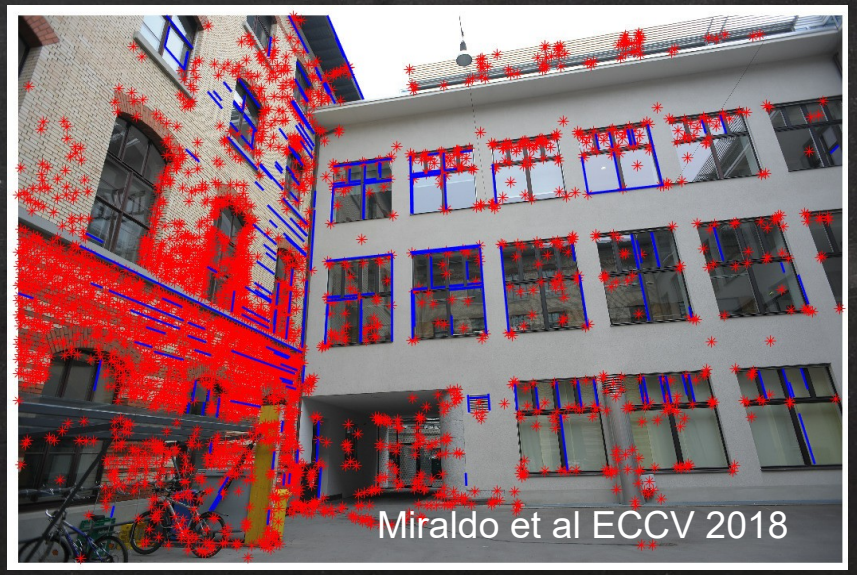
6-point problem

0 solutions
not minimal

Fundamental Research Questions

1. Can we list **all** minimal problems?
2. How many solutions do they have?

We do not only want to work with points,
but also with lines and their incidences!

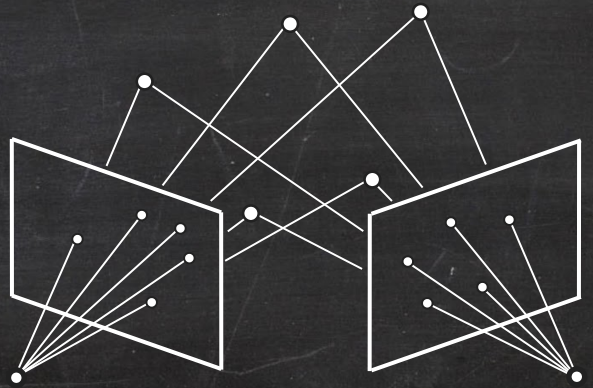


Our Result

We provide the **first complete classification of all minimal problems** when all points and lines are visible in each given image.

Our Result

We provide the **first complete classification of all minimal problems** when all points and lines are visible in each given image.



The 5-point problem has 20 solutions.

RESULT

There are **exactly 30 minimal problems** for *complete multi-view visibility* (modulo extra lines in 2 views).

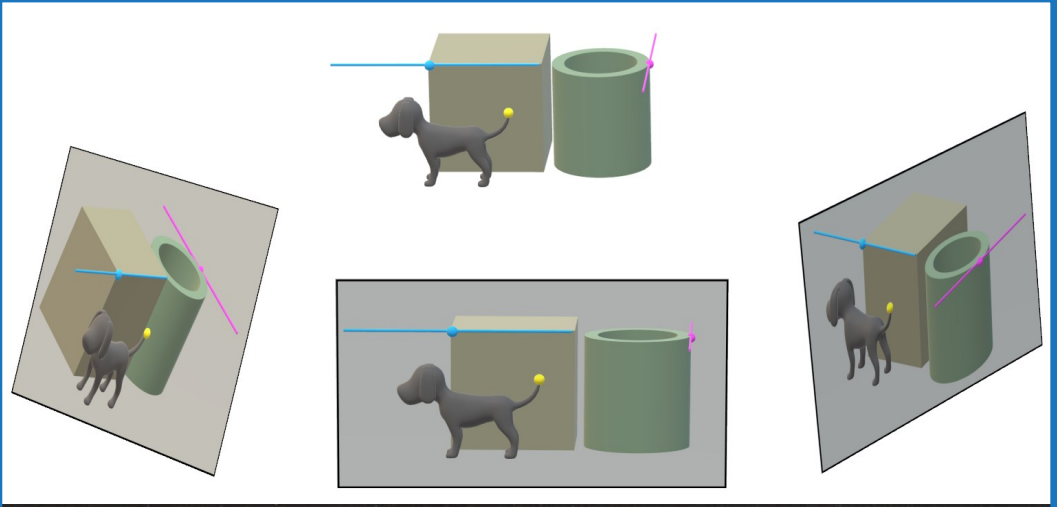
# views	6	5	5	5	4
					
# sols	$\approx 10^6$	11296	26240	11008	3040
# views	4	4	4	4	4
					
# sols	4512	1728	32	544	544
# views	3	3	3	3	3
					
# sols	360	552	480	264	432
# views	3	3	3	3	3
					
# sols	328	480	240	64	216
# views	3	3	3	3	3
					
# sols				144	144
# views	3	3	2	2	2
					
# sols	144	64	20	16	12

Our Result

We provide the **first complete classification of all minimal problems** when all points and lines are visible in each given image.

First solver for such a high-degree problem based on state-of-the-art algorithms from **numerical algebraic geometry:**

TRPLP – Trifocal Relative Pose from Lines at Points, Fabbri et. al., CVPR 2020



This problem has 312 solutions
(counted over the complex numbers).

RESULT

There are **exactly 30 minimal problems** for *complete multi-view visibility* (modulo extra lines in 2 views).

# views	6	5	5	5	4
# sols	$\approx 10^6$	11296	26240	11008	3040

# sols	312	224	40	144	144
# views	[illegible]	3	2	2	2
# sols	144	64	20	16	12

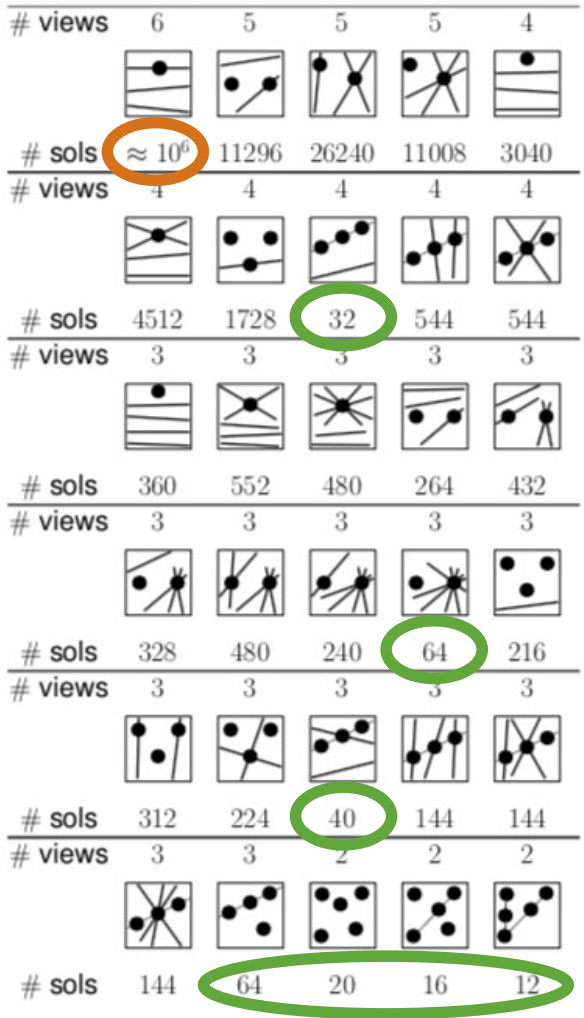
Our Result

We provide the **first complete classification of all minimal problems** when all points and lines are visible in each given image.

We **measure the complexity of each minimal problem** by computing its number of solutions
(counted over the complex numbers).

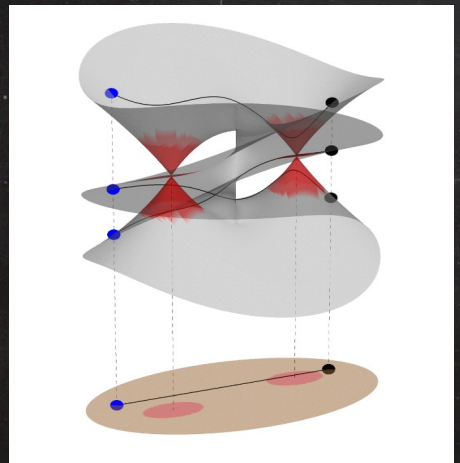
RESULT

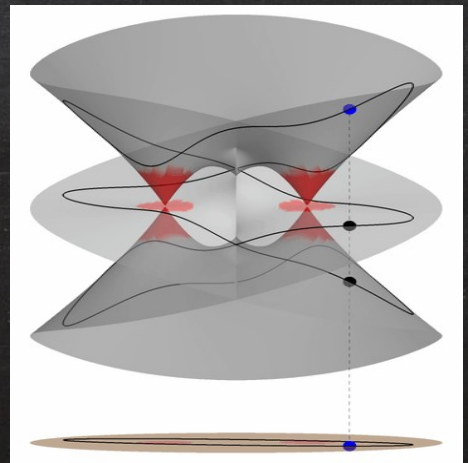
There are **exactly 30 minimal problems** for *complete multi-view visibility* (modulo extra lines in 2 views).



Our Tools: Nonlinear Algebra

- Algebraic geometry
  for proof of classification
- Gröbner bases
  symbolic computation of #sols
  for 2 & 3 views
- Homotopy continuation & monodromy
  numerical computation of #sols
  for 4, 5 & 6 views





RESULT

There are **exactly 30 minimal problems** for *complete multi-view visibility* (modulo extra lines in 2 views).
